J. Biol. Chem. 277:13528-13538 (2002).
-!- FUNCTION: Heme-containing signal transducer responsible for aerotaxis, the migratory response toward or away from oxygen.
-!- SUBUNIT: Homotetramer (Probable).
-!- SIMILARITY: Contains 1 methyl-accepting transducer domain.
                                                                                                                                                                                                                                                                                                                                                                            MEDLINE=21950695; PubMed=11821422;

Nature 409:1007-1011(2001).
-!- CATALYTIC ACTIVITY: Acyl-CoA + sn-glycerol 3-phosphate = CoA + 1-acyl-sn-glycerol 3-phosphate.
-!- PATHWAY: De novo phospholipid biosynthesis; first step. May also function in the regulation of membrane biogenesis.
-!- SUBCELLULAR LOCATION: Membrane-bound (By similarity).
-!- SIMILARITY: Belongs to the GPAT / DAPAT family.
                                                                                                                                                                                  MEDLINE=21128732; PubMed=11234002;

Three different but related gene clusters encoding gas vesicles in halophilic archaea.";
J. Mol. Biol. 227:586-592(1992).
-!- FUNCTION: May confer stability to the gas vesicle membranes. Gas vesicles are small, hollow, gas filled protein structures that are found in several microbial planktonic microorganisms. They allow the positioning of the organism at the favorable depth for growth.
-!- SUBCELLULAR LOCATION: Binds to the external surface of the gas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          185 RDGHKDVADAFLQYREFHGVEVQSLLDNIAAFQREMGDYRKAFETTEEAFASF 238

"Sensory thodopsin II transducer Hirli is also responsible for serine chemotaxis in the archaeon Halobacterium salinarum.";

"Bacteriol. 180:1600-1602(1998).

-!- FUNCTION: Transduces signals from the phototaxis receptor sensory rhodopsin II (SR-II) to the flagellar motor. Responds to light changes through the variation of the level of methylation. Also acts as a chemotransducer.

-!- SUMSCELEULAR LOCATION: Integral membrane protein (By similarity).

-!- SIMILARITY: Contains 1 methyl-accepting transducer domain.
